

This screenshot shows the automated execution of the script. I enabled Wizard Mode, inputted the target IP and a custom wordlist, and selected Level 2 for all phases. The script successfully automated the Scanning, Enumeration, and Exploitation processes without manual intervention.

```
[roy@kali]~[/Desktop]
$ sudo ./domain_mapper.sh
>>> Domain Mapper Initializing...
Need help before we start? (y/n): y
=====
Domain Mapper Help:
Just follow the prompts to enter your target and AD info.
The script will scan, enumerate, and test for vulns.
At the end, you'll get a PDF report with all the data.
=====
Target IP or Range: 192.168.1.39
Domain Name:
AD Username: msfadmin
AD Password: msfadmin
Wordlist path [press enter for rockyou]: /home/roy/Desktop/short_list.txt
Select scan levels (0 = Skip, 1 = Basic, 2 = Mid, 3 = High)
Scanning level: 2
Enumeration level: 2
Exploitation level: 2
>> Phase 1: Running network scans...
Done scanning.
>> Phase 2: Gathering info (Enum)...
>> Phase 3: Commencing attacks...
Trying password spray... this might take a while.
Attacks done.
>> Saving everything to PDF...
All good! Report is saved as Domain_Mission_Report.pdf
```

Here is the final PDF report generated automatically by the script. It clearly displays the scan results, identified services (like vsftpd and OpenSSH), and extracted data, proving the script successfully captures and formats the output as required.
